Review: Binary representation

- What number is this?

$$\Rightarrow 2^7 + 2^6 + 2^3 + 2^2 + 2^0$$

$$\Rightarrow 128 + 64 + 8 + 4 + 1$$

$$\Rightarrow 192 + 13 = 205$$

A. 200

B. 203

C. 205

D. 206

Review: Binary representation

- What number is this?

1	1	0	0	1	1	0	1
---	---	---	---	---	---	---	---

 = 205

Review: Demo

- `uint8_t bin8_to_dec(char bin_arr[])`

How do we **add** two binary numbers together?

Decimal

$$\begin{array}{r} 15 \\ + 8 \\ \hline 23 \end{array}$$

Binary

$$\begin{array}{r} 01111 \quad (15) \\ + 01000 \quad (8) \\ \hline 10111 \quad (23) \end{array}$$

How should we represent **negative** numbers in binary?

Sign bit { 1 $\Rightarrow$ negative #
0 $\Rightarrow$ positive #

$$-5 + 1 = -4$$

1 1 0 1 (-5) sign magnitude

Sum
(4-bit)

$$\begin{array}{r} 1\ 1\ 0\ 1\ (-5) \\ +\ 0\ 0\ 0\ 1\ (1) \\ \hline 1\ 1\ 1\ 0\ (-6) \end{array}$$

$$-4 \neq -6$$

0 0 0 0 = +0
1 0 0 0 = -0?

How should we represent **negative** numbers in binary?

- Two's complement

- signed values = negative & positive #s

b bits

-128	64	32	16	8	4	2	1
-2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0

0 1 1 1 1 1 1 1
 $\Rightarrow -128$

- Min =

$$-2^{b-1}$$

- Max =

$$2^{b-1} - 1 \Rightarrow 127$$

-64

11000000

↓

$$-(2^7) + 2^6 \Rightarrow -128 + 64 = -64$$

$$- \dots \frac{100}{2} = 4$$

$$\frac{1000}{2^2} = 2^3 = 8$$

4-bit

What is the two's complement value?

• 1001

$$-(2^3) + 2^0 \Rightarrow -8 + 1 = -7$$

$$\begin{aligned} & \underline{-1} \times 2^3 + \underline{0} \times 2^2 + \underline{0} \times 2^1 + \underline{1} \times 2^0 \\ & \Rightarrow -8 + 1 = -7 \end{aligned}$$

• 1111

$$\begin{aligned} & -(2^3) + 2^2 + 2^1 + 2^0 \\ & \Rightarrow -8 + 4 + 2 + 1 = -1 \end{aligned}$$

$$2^2 + 2^0 = 4 + 1 = 5$$

1010 + 1 = 1011 = -5?

A. -8 & 4

B. -7 & 5

C. -1 & 5

D. -1 & 4

What is the two's complement value?

- $1001 = -7$

- $1111 = -1$

- $0101 = 5$

Two's complement

- **Signed** values in C are represented as **two's complement**
 - Lets us represent both positive and negative values
 - Example data types: `char`, `int`, `int8_t`
- **Unsigned** values in C only represent values ≥ 0
 - Example data types: `unsigned char`, `unsigned int`, `uint8_t`

What is the two's complement sum in binary and decimal?

- $1001 + 0001$

$$\begin{array}{r} 1001 \\ + 0001 \\ \hline 1010 \Rightarrow -6 \end{array}$$

(-7)
(1)
-6

- $1010 + 0010$

$$\begin{array}{r} 1010 \\ + 0010 \\ \hline 1100 = -4 \end{array}$$

(-6)
(2)

- $0111 + 0001$

$$\begin{array}{r} 0111 \\ + 0001 \\ \hline 1000 \end{array}$$

(7)
(1)
(-8)

$$7+1 = 8$$

A. -6 , 0

B. -4 , -1

C. -5 , 0

D. -4 , 0

E. -4 , -8

What is the two's complement sum in binary and decimal?

- $1001 + 0001 = -7 + 1 = 1010 \text{ (-6)}$
- $1010 + 0010 = -6 + 2 = 1100 \text{ (-4)}$
- $0111 + 0001 = 7 + 1 = 1000 \text{ (-8) overflow!}$

Why do we integer overflow?

- Two's complement makes addition in hardware easier

Why do we integer overflow?

- Two's complement makes addition in hardware easier
- Fixed number of bits
- Side effect: **overflow!**

Consequences of overflow

- Psy's Gangnam Style MV nearly overflowed Youtube's 32-bit view counter
- 1980 Pacman glitched when 8-bit level counter overflows
- Therac-25 radiation therapy machine would overflow, bypassing a safety mechanism, harming 6 patients

Common data types in C

$$\begin{array}{r} 1111 \quad 1111 = 255 \\ + 0000 \quad 0001 \\ \hline 1 \quad 1111 \quad 0000 = 0 \end{array}$$

- Integer data types

- `char = 'A'; // 1 byte signed`
- `unsigned char = 255; // 1 byte unsigned`

- `int/int32_t = -5; // 4 bytes signed`
- `unsigned int/uint32_t = 5; // 4 bytes unsigned`

- `long long int/int64_t = -10; // 8 bytes signed`
- `unsigned long long int/uint64_t = 10; // 8 bytes unsigned`

How to copy a **small int** into **larger sized int**?

- Need to handle copying a smaller two's complement into a larger one

```
int16_t a_s = -1; // 2 bytes
int a = a_s; // 4 bytes
printf("a = %d a_s = %d\n", a, a_s);
```

-1 $\Rightarrow$ 11111111 11111111

11111111 11111111

~~11111111 11111111~~
11111111 11111111

A. print same value for both
B. print different values

Sign extensions

Practice

Assume a machine where the size of an integer is 1 byte. Assume two's complement to represent signed numbers.

1. What is the max value of an unsigned integer on this machine?

1111 1111

$$2^7 + 2^6 + 2^5 + 2^4 + 2^3 + 2^2 + 2^1 + 2^0 = \boxed{255}$$

2. What is the max value of a signed integer on this machine?

0111 1111

$$0 \times [-(2^7)] + 2^6 + 2^5 + 2^4 + 2^3 + 2^2 + 2^1 + 2^0 = \boxed{127}$$

Practice

Assume a machine where the size of an integer is 1 byte. Assume two's complement to represent signed numbers.

3. What is the minimum value of a signed integer on this machine?

$$1000\ 0000$$
$$-(2^7) + 0 + \dots + 0 = \boxed{-128}$$

4. How is the signed integer -1 represented on this machine?

$$\boxed{1111\ 1111}$$

Practice

Assume a machine where the **size of an integer is 1 byte**. Assume **two's complement** to represent signed numbers.

5. What is the value of the number `0b10000000` when it is interpreted as

a. **Unsigned** integer

$$2^7 + 0 + \dots + 0 = \boxed{128}$$

b. **Signed** integer

$$-(2^7) + 0 + \dots + 0 = \boxed{-128}$$
